

Draw wireframes or mockups of each of your screens in your software. You can use the drawing software of your choice (Powerpoint, Figma, MS Paint etc) to create each wireframe. You do not need to have one wireframe per testing scenario.

Write two testing scenarios for your system, which describes a user completing a task in your software.

- Users will add 1-minute, 3-minute and 5 minute reminder tasks. In this, the user is going to 'check' and 'uncheck' each task to make sure the pause time

mechanism works. This is also to make sure that each task's timer mechanism works independently from one another.

- The user will test useability and functionality of each button for the to-do list. Therefore the user will make sure the add task button adds a task when clicked on or when "enter key" is pressed. Additionally, the user will check whether the drop down priority works and also set the time and priority for the task. While also the user will also be able to use the "clear all tasks" button so once checked off they can clear all of tasks.
